

# Hogia Instant Situation

Instant Situation allows you to register events that affect public transport and gain a complete overview of the situation.

Use Hogia Instant Situation to register events that affect public transport traffic flows. This tool automatically calculates what the consequences would be and presents the current situation in a map view. An invaluable tool for fact-based traffic management, and for providing accurate information to passengers.

It is often a challenge to predict the exact consequences an event will have. For instance, roadworks not only affect the routes adjacent to the work site, but also the routes along which the traffic needs to be redirected. In these scenarios, Hogia Instant Situation is a powerful tool that gives your organisation a complete overview of the situation at hand.

Simply use the intuitive interface to enter information about the event and its extent. The tool will then take over and calculate exactly how the event will impact public transport. The situation is presented in a comprehensive map view where you can zoom in for more detailed information.

Hogia Instant Situation quickly and effectively manages both planned and unplanned events and ensures that everyone in your organisation gets the same information. Because everyone's data comes from the same source, actions can be harmonised while passengers are given consistent information and can travel without disruption.

# Hogia Instant Situation

---

Instant Situation is also a powerful analysis tool. All events are stored along with their consequences and the actions taken, which makes it possible to subsequently analyse how the situation was handled and what effects your actions had.

**Use Hogia Instant Situation to:**

- ✓ Register events directly in the tool
- ✓ Gain an immediate overview of the situation
- ✓ Zoom in to see detailed facts
- ✓ Perform analysis via the storage function

## HOGIA INSTANT SITUATION

*- part of Hogia's family of products for more efficient public transport*

Hogia's Instant product family sets a new standard for the monitoring and management of public transport. These cloud-based platform-independent products can be mixed and matched to your needs, and together they create a complete tool under a common interface.

**Instant View** – *see a real-time overview of the public transport network*

**Instant Activate** – *quickly activate alternative services when needed*

**Instant Situation** – *register events that affect public transport and gain a complete overview of the situation*
